Announcement card: Systematic Equities (print this; keep it next to the bot console)

Why it matters. After an announcement the house takes about **45 s** to reprice (packet §5). The research data has no announcements, so most teams will be slow. Our engine is built from explicit parameters, so most headlines become **one `ov` line**. Target: the override typed within **10 s** of the headline.

What happens automatically

1. The bot raises the alert `ANNOUNCEMENT: <headline> -> frozen ...`.
2. It **freezes** the named symbols, their linked names, and the ETFs that hold them, and cancels their orders.

Linked names:

Named	Also frozen
HAVEN	REIN, MAT
REIN	HAVEN, MAT
MAT	HAVEN, REIN
GRID	GEN, RECON, HAVEN, REIN, MAT
PORT, FERRY	RECON, HAVEN, REIN, MAT
ISLE, AQUA	HAVEN, REIN, MAT

What you do (in order)

1. **Read the headline. Decide: does it change a formula below?**
   - **No** (pure noise, already priced, or no economic effect): type `u SYM` for each frozen symbol. Done.
   - **Yes:** go on to step 2.
2. **Type the override:** `ov PARAM VALUE` (examples below). It applies to the whole season. `ov PARAM off` undoes it.
3. **Trade toward the new value:**
   - `ua SYM` for each symbol whose value changed. Include the ETF that holds it: ARCH holds 1 PORT, 1 ISLE, 2 AQUA, 1 GRID, 2 FERRY and 1 HAVEN; REBLD holds 2 RECON, 2 MAT and 1 GEN.
   - The bot then buys or sells toward the new value for 45 s, in clips of about L/12, capped at **half the position limit**. It stops once the house has covered 80% of the gap.
4. **Unfreeze the linked names the headline does not affect:** `u SYM`.
5. **Wrong call?** Type `ov PARAM off`, then `x SYM` to stop trading it, or `k` for everything.

Rehearsed offline on 23 Oct. A fake "HavenBridge raises its retention to $500M" was injected into season 225 round 3, then `ov haven.attach 500` and `ua HAVEN` were typed. The bot took HAVEN from −130 to +125 (half the limit) in 20-share clips over 26 s. Run: `sim/out/announce_rehearsal`.

The formulas being changed

Group	Formula	Current values
Islands	value = V0 − a·D − K·(closed weight-seconds); D = season damage in % points	PORT 100 / 0.55 / 0.02 · ISLE 60 / 0.38 / 0 · AQUA 35 / 0.20 / 0 · GRID 50 / 0.24 / 0.05 · FERRY 25 / 0.05 / 0.06
HAVEN	75 − slope·clip(L − attach, 0, top − attach); L = season insured loss, $M	v0 75, slope 0.06, attach 400, top 1300 (floor 21)

Group	Formula	Current values
REIN	90 − slope·max(L − attach, 0)	v0 90, slope 0.035, attach 1300
RECON	a + b·(1 − e^(−X/c)); X = 9·PORT% + 7·GRID% + 1.2·FERRY% ($M, season)	a 40, b 24, c 1000
MAT	a + b·(1 − e^(−L/c))	a 28, b 14, c 1200
GEN	a + b·(1 − e^(−O/c)); O = grid closure weight-seconds	a 32, b 18, c 120
Damage rate (future storms)	site loses 1 − e^(−k·m·hazard) of its remaining value	k (`SYM.dmg`): PORT 0.0110, ISLE 0.0087, AQUA 0.0155, GRID 0.0117, FERRY 0.0085

Headline → override

Effects are per share. "At the limit" means the full position limit; the bot trades at most half of it.

Headline type	Type this	Effect per share	Also
HavenBridge **raises** its retention to $R M	`ov haven.attach R`	HAVEN up by 0.06 × (R − 400) once the season loss passes R; e.g. R = 500: **up to +$6**	`ua HAVEN` , `ua ARCH` ; `u REIN` , `u MAT`
HavenBridge **lowers** its retention to $R M	`ov haven.attach R`	HAVEN down by up to 0.06 × (400 − R)	as above
Reinsurance now starts at $T M (was 1,300)	`ov haven.top T` and `ov rein.attach T`	HAVEN's floor rises from 21 to 75 − 0.06 × (T − 400) (T = 1,000: floor 39, **up to +$18**). REIN pays from T: **down to −$10.50** at T = 1,000, L = 1,300	`ua HAVEN` , `ua REIN` , `ua ARCH` ; `u MAT`
HavenBridge cedes x% of its layer (quota share)	`ov haven.slope 0.06×(1−x)`	e.g. 50%: slope 0.03, **up to +$27** at L ≥ 1,300	`ua HAVEN` , `ua ARCH`
Meridian Re's limit / exposure capped at $C M	`ov rein.slope …` or `ov rein.top …` (judgment)	REIN's downside shrinks	`ua REIN`
Government covers x% of the port's repairs	`ov port.a 0.55×(1−x)`	PORT up by x × 0.55 × D; e.g. D = 50, x = 50%: **+$13.75**	`ua PORT` , `ua ARCH` ; RECON unchanged (the work is the same): `u RECON`
Same for resorts / fisheries / grid / ferries	`ov isle.a …` , `ov aqua.a …` , `ov grid.a …` , `ov ferry.a …`	x × a × D	`ua SYM` , `ua ARCH`
Outage costs covered, or fares compensated	`ov grid.k 0` / `ov ferry.k 0`	GRID up by 0.05 × closed weight-seconds; FERRY by 0.06 ×	`ua SYM` , `ua ARCH`
Outages will last longer (e.g. no spare transformers)	`ov grid.k …` up (judgment)	GRID down; GEN up (more outage)	`ua GRID` , `ua GEN` , `ua ARCH`
Port, resort or grid hardening (future storms do less)	`ov port.dmg 0.0055` (half rate), etc.	Only future storms; the engine reprices the rest of the season	`ua SYM` , `ua ARCH`
Tourism collapse / bookings boost for resorts	`ov isle.v0 …`	ISLE ± the change in V0	`ua ISLE` , `ua ARCH`
Reconex adds crews / wins more contracts	`ov recon.b …` (a higher ceiling; judgment)	RECON up	`ua RECON` , `ua REBLD`
Reconex loses crews or a contract	`ov recon.b …` down	RECON down	`ua RECON` , `ua REBLD`
Materials price controls / supply shock	`ov mat.b …`	MAT ±	`ua MAT` , `ua REBLD`
GridLock buys its own generators	`ov gen.b …` down	GEN down	`ua GEN` , `ua REBLD`

Judgment calls. The rebuilders' "capacity" headlines can map to the ceiling `b` or to the saturation scale `c` . Default to `b` (proportional to the stated capacity change), and size down if unsure: `ua` for 15 s, then `u` .

Rules

- Never `ua` a symbol whose effect you cannot write as a number.
- **Round 3 after about 700 s:** an announced symbol enters the final-report trade (S1-r3) only after `s1ok SYM`, confirmed by a second person.
- Log every override with the headline (the bot logs `override` events). Overrides reset at each new season.
